Question #401

From among ten stones, a jeweler will select six, one for each of six rings. Of the stones, three F, G, and H are rubies; three J, K, and M are sapphires; and four W, X, Y, and Z are topazes. The selection of stones must meet the following restrictions:

At least two of the topazes are selected.

If exactly two of the sapphires are selected, exactly one of the rubies is selected.

If W is selected, neither H nor Z is selected.

If M is selected, W is also selected.

Which one of the following could be the selection of stones?

- A. F, G, H, M, X, Y
- B. F, G, J, K, M, W
- C. F, G, J, K, W, X
- D. G, H, J, X, Y, Z
- E. G, H, K, W, X, Z

Answer: D

Even if you were blown away by this game's rules, this is a point worth getting, and worth getting quickly. Rule 1's requirement of 2 topazes minimum is violated by

B.. Rule 2's 2 sapphires : 1 ruby ratio is violated by C., which gives us 2 : 2 : 2. Rule 3 is violated by E., which gives us W, H, and Z all at once. And Rule 4 is violated by A., which gives us M without W. D. must be correct sight unseen, and perhaps finding it, and then analyzing it, can provide us with some needed insight into the game and the heart to keep going with it.

Question #402

From among ten stones, a jeweler will select six, one for each of six rings. Of the stones, three F, G, and H are rubies; three J, K, and M are sapphires; and four W, X, Y, and Z are topazes. The selection of stones must meet the following restrictions:

At least two of the topazes are selected.

If exactly two of the sapphires are selected, exactly one of the rubies is selected.

If W is selected, neither H nor Z is selected.

If M is selected, W is also selected.

Which one of the following must be true?

- A. G is selected.
- B. J is selected.
- C. X is selected.
- D. Of at least one of the three types of stones, exactly one stone is selected.
- E. Of at least one of the three types of stones, exactly three stones are selected.

Answer: E

Those who worked out the number options we laid out above had no trouble with this one. No matter how you slice it, at least one stone type and possibly two are represented by exactly 3 stones. And even if you didn't work out every possibility, simply seeing that 2 : 2 : 2 was an impossible ratio (because of Rule 2) might have led you to suspect that E. was a true statement. A., B., and C. are far from necessarily true; there are lots of possibilities in which G, J, and X respectively are not present. And the possibility of choosing, say, 3 sapphires + 3 topazes means that D. need not be true either.

Question #403

From among ten stones, a jeweler will select six, one for each of six rings. Of the stones, three F, G, and H are

rubies; three J, K, and Mare sapphires; and four W, X, Y, and Z are topazes. The selection of stones must meet the following restrictions:

At least two of the topazes are selected.

If exactly two of the sapphires are selected, exactly one of the rubies is selected.

If W is selected, neither H nor Z is selected.

If M is selected, W is also selected.

If Z is selected, which one of the following could be true?

- A. All three of the sapphires are selected.
- B. Both J and M are selected.
- C. Both K and M are selected.
- D. None of the rubies is selected.
- E. None of the sapphires is selected.

Answer: E

Write out your roster, circle Z on it, and realize that that's a trigger for rejecting W (Rule 3s contrapositive) and thus for rejecting M (Rule 4s contrapositive). That's all we need. With sapphire M gone, clearly A., B., and C. are impossible. And if D. were true, no rubies, our remaining 2 sapphires and maximum of 3 topazes would leave us short of our desired total of 6. So E. is possible by default. Indeed, all three rubies plus topazes X, Y, Z would constitute an acceptable set of 6.

Question #404

From among ten stones, a jeweler will select six, one for each of six rings. Of the stones, three F, G, and H are rubies; three J, K, and M are sapphires; and four W, X, Y, and Z are topazes. The selection of stones must meet the following restrictions:

At least two of the topazes are selected.

If exactly two of the sapphires are selected, exactly one of the rubies is selected.

If W is selected, neither H nor Z is selected.

If M is selected, W is also selected.

If exactly two rubies are selected, which one of the following must be true?

- A. H is selected.
- B. J is selected.
- C. Z is selected.
- D. Exactly one sapphire is selected.
- E. Exactly two topazes are selected

Answer: D

This is sheer arithmetic. If we choose exactly 2 rubies, we cannot choose 2 topazes (remember, 2 : 2 : 2 is forbidden, so we need exactly 3 topazes (and have proved that E. is impossible, incidentally). And 2 rubies + 3 topazes only = 5 stones, so there will be exactly 1 sapphire chosen, choice D. What that sapphire is, is unclear; it could be J, as B. suggests, but need not. And A. and C. are much more certain as to the identity of particular stones than we can possibly be, under this question's circumstances.

Question #405

From among ten stones, a jeweler will select six, one for each of six rings. Of the stones, three F, G, and H are rubies; three J, K, and M are sapphires; and four W, X, Y, and Z are topazes. The selection of stones must meet the following restrictions:

At least two of the topazes are selected.

If exactly two of the sapphires are selected, exactly one of the rubies is selected.

If W is selected, neither H nor Z is selected.

If M is selected, W is also selected.

Which one of the following must be true?

- A. The selection of stones includes at least one ruby.
- B. The selection of stones includes at most two rubies.

- C. The selection of stones includes either F or Z, or both.
- D. The selection of stones includes either X or Y, or both.
- E. The selection of stones includes either X or Z, or both.

Answer: D

We have deduced that at least two topazes must be chosen at all times. And which two? Hard to say; but since we can never choose W and Z together (Rule 3), we will always need to choose at least one of the remaining topazes. That's all that D. is saying. Our work in Step 4, above, demonstrates that neither A. nor B. need be true. Contrary to both A. and B., we could choose no rubies at all (if we used 3 sapphires and 3 topazes). The remaining choices may require a little trial and error, but the selection of, for instance, "G,J,K,M,W,Y" proves that neither C. nor E. need be true.

Question #406

From among ten stones, a jeweler will select six, one for each of six rings. Of the stones, three F, G, and H are rubies; three J, K, and M are sapphires; and four W, X, Y, and Z are topazes. The selection of stones must meet the following restrictions:

At least two of the topazes are selected.

If exactly two of the sapphires are selected, exactly one of the rubies is selected.

If W is selected, neither H nor Z is selected.

If M is selected, W is also selected.

If J and M are the only sapphires selected, which one of the following could be true?

- A. F and G are both selected.
- B. F and X are both selected.
- C. G and H are both selected.
- D. G and K are both selected.
- E. Y and Z are both selected.

Answer: B

Interestingly, if frustratingly, this last question proves to be one of the most concrete, and hence one of the easiest. We hope that you didn't get bogged down on some of the earlier ones and miss out on this one. In your roster, select J and M, and cross out K, in line with the question stems if. Rule 4 requires that you select W, and Rule 3 requires that you cross out H and Z. At the same time, Rule 2 (we use it at last!) kicks in there will be exactly 1 ruby chosen, and hence 3 sapphires. And with Z gone, those 3 sapphires are W, X, and Y. So: J, M, W, X, and Y are definitely chosen, and the final stone will be a ruby, either F or G. B. is therefore the only possibility among the choices. A. would stick us with a total of 7 stones. And each of the remaining choices mentions a stone that we have definitively rejected: H in C., K in D., and Z in E.

Question #407

There are exactly ten stores and no other buildings on Oak Street. On the north side of the street, from west to east, are stores 1, 3, 5, 7, and 9; on the south side of the street, also from west to east, are stores 2, 4, 6, 8, and 10. The stores on the north side are located directly across the street from those on the south side, facing each other in pairs, as follows: 1 and 2; 3 and 4; 5 and 6; 7 and 8; 9 and 10. Each store is decorated with lights in exactly one of the following colors: green, red, and yellow. The stores have been decorated with lights according to the following conditions:

No store is decorated with lights of the same color as those of any store adjacent to it.

No store is decorated with lights of the same color as those of the store directly across the street from it.

Yellow lights decorate exactly one store on each side of the street.

Red lights decorate store 4.

Yellow lights decorate store 5.

Which one of the following could be an accurate list of the colors of the lights that decorate stores 2, 4, 6, 8, and 10, respectively?

- A. green, red, green, red, green
- B. green, red, green, yellow, red
- C. green, red, yellow, red, green

- D. yellow, green, red, green, red
- E. yellow, red, green, red, yellow

Answer: B

The right answer is an acceptable matching for the five south side streets, and we've got most of that worked out. Stores 4 and 6 are red and green respectively, so C. and D. can be crossed out. There is one and only one yellow light, so A. with no yellows and E. with two are both eliminated. B. is all that's left.

Question #408

There are exactly ten stores and no other buildings on Oak Street. On the north side of the street, from west to east, are stores 1, 3, 5, 7, and 9; on the south side of the street, also from west to east, are stores 2, 4, 6, 8, and 10. The stores on the north side are located directly across the street from those on the south side, facing each other in pairs, as follows: 1 and 2; 3 and 4; 5 and 6; 7 and 8; 9 and 10. Each store is decorated with lights in exactly one of the following colors: green, red, and yellow. The stores have been decorated with lights according to the following conditions:

No store is decorated with lights of the same color as those of any store adjacent to it.

No store is decorated with lights of the same color as those of the store directly across the street from it.

Yellow lights decorate exactly one store on each side of the street.

Red lights decorate store 4.

Yellow lights decorate store 5.

If green lights decorate store 7, then each of the following statements could be false EXCEPT:

- A. Green lights decorate store 2.
- B. Green lights decorate store 10.
- C. Red lights decorate store 8.
- D. Red lights decorate store 9.
- E. Yellow lights decorate store 2.

Answer: D

A mini-sketch for this question should recopy what we know and add "G" to store 7. Store 9, which we knew was "G/R," is now definitively "R." And that's it; we cannot confirm anything more on the south side. But that's enough: store 9 has to be red, so D. cannot be false.

Of A. and E., exactly one is true: store 2 is green or yellow but we don't know which. Store 8 could be red or yellow, so C. can be false. And store 10 remains uncertain, so B. can be false too.

Question #409

There are exactly ten stores and no other buildings on Oak Street. On the north side of the street, from west to east, are stores 1, 3, 5, 7, and 9; on the south side of the street, also from west to east, are stores 2, 4, 6, 8, and 10. The stores on the north side are located directly across the street from those on the south side, facing each other in pairs, as follows: 1 and 2; 3 and 4; 5 and 6; 7 and 8; 9 and 10. Each store is decorated with lights in exactly one of the following colors: green, red, and yellow. The stores have been decorated with lights according to the following conditions:

No store is decorated with lights of the same color as those of any store adjacent to it.

No store is decorated with lights of the same color as those of the store directly across the street from it.

Yellow lights decorate exactly one store on each side of the street.

Red lights decorate store 4.

Yellow lights decorate store 5.

Which one of the following statements must be true?

- A. Green lights decorate store 10.
- B. Red lights decorate store 1.
- C. Red lights decorate store 8.
- D. Yellow lights decorate store 8.
- E. Yellow lights decorate store 10.

Answer: B

This one is a slam-dunk. We have deduced that store 1 has red lights.

Question #410

There are exactly ten stores and no other buildings on Oak Street. On the north side of the street, from west to east, are stores 1, 3, 5, 7, and 9; on the south side of the street, also from west to east, are stores 2, 4, 6, 8, and 10. The stores on the north side are located directly across the street from those on the south side, facing each other in pairs, as follows: 1 and 2; 3 and 4; 5 and 6; 7 and 8; 9 and 10. Each store is decorated with lights in exactly one of the following colors: green, red, and yellow. The stores have been decorated with lights according to the following conditions:

No store is decorated with lights of the same color as those of any store adjacent to it.

No store is decorated with lights of the same color as those of the store directly across the street from it.

Yellow lights decorate exactly one store on each side of the street.

Red lights decorate store 4.

Yellow lights decorate store 5.

If green lights decorate five stores on the street, then which one of the following statements must be true?

- A. Green lights decorate store 9.
- B. Red lights decorate store 2.
- C. Red lights decorate store 7.
- D. Red lights decorate store 10.
- E. Yellow lights decorate store 8.

Answer: E

The trick here is to figure out which of the ten stores are the five that will have green lights. On the north side, with store 3 always green, we will have to have a green light in store 7 or 9. (Remember, adjacent greens are prohibited.) It may be smart to draw out both possibilities. And happily the south side is determinable.

On the south side, we need three more greens, and clearly theyll have to be stores 2, 6, and 10. And with store 4 always red, the requisite (Rule 3) yellow will go to store 8. So here are the two options:

R G Y G R	or	R G Y R G
G R G Y G		G R G Y G

SAMPLE QUESTIONS

*These questions are for demo purpose only. **Full version** is up to date and contains actual questions and answers.*

Killexams.com is an online platform that offers a wide range of services related to certification exam preparation. The platform provides actual questions, exam dumps, and practice tests to help individuals prepare for various certification exams with confidence. Here are some key features and services offered by Killexams.com:

Actual Exam Questions: *Killexams.com provides actual exam questions that are experienced in test centers. These questions are updated regularly to ensure they are up-to-date and relevant to the latest exam syllabus. By studying these actual questions, candidates can familiarize themselves with the content and format of the real exam.*

Exam Dumps: *Killexams.com offers exam dumps in PDF format. These dumps contain a comprehensive collection of questions and answers that cover the exam topics. By using these dumps, candidates can enhance their knowledge and improve their chances of success in the certification exam.*

Practice Tests: *Killexams.com provides practice tests through their desktop VCE exam simulator and online test engine. These practice tests simulate the real exam environment and help candidates assess their readiness for the actual exam. The practice tests cover a wide range of questions and enable candidates to identify their strengths and weaknesses.*

Guaranteed Success: *Killexams.com offers a success guarantee with their exam dumps. They claim that by using their materials, candidates will pass their exams on the first attempt or they will refund the purchase price. This guarantee provides assurance and confidence to individuals preparing for certification exams.*

Updated Content: *Killexams.com regularly updates its question bank and exam dumps to ensure that they are current and reflect the latest changes in the exam syllabus. This helps candidates stay up-to-date with the exam content and increases their chances of success.*

Technical Support: *Killexams.com provides free 24x7 technical support to assist candidates with any queries or issues they may encounter while using their services. Their certified experts are available to provide guidance and help candidates throughout their exam preparation journey.*
